Introduction

Context :

1. Alternative Splicing (AS)

- Definition

[NIH](#) → “Alternative splicing is a cellular process in which exons from the same gene are joined in different combinations, leading to different, but related, mRNA transcripts. These mRNAs can be translated to produce different proteins with distinct structures and functions, all from a single gene. “

Introduction

Context :

1. Alternative Splicing

- Types

Introduction

Context :

1. Alternative Splicing

- In immune cells, what we know...
- [1] STING gene → Exon skipping ⇒ **Viral DNA sensing**
- [2] IFNAR2 gene → Exon skipping ⇒ **IFN sensing & Immunomodulatory effects**
- [3] IRF7 gene → ES, IR, Alternative splicing sites ⇒ **IFN pathway modulation**
- ...

Introduction

Context :

1. Alternative Splicing

- In plasmacytoid Dendritic Cells (pDC)

Introduction

Context :

1. Alternative Splicing

- In plasmacytoid Dendritic Cells (pDC)

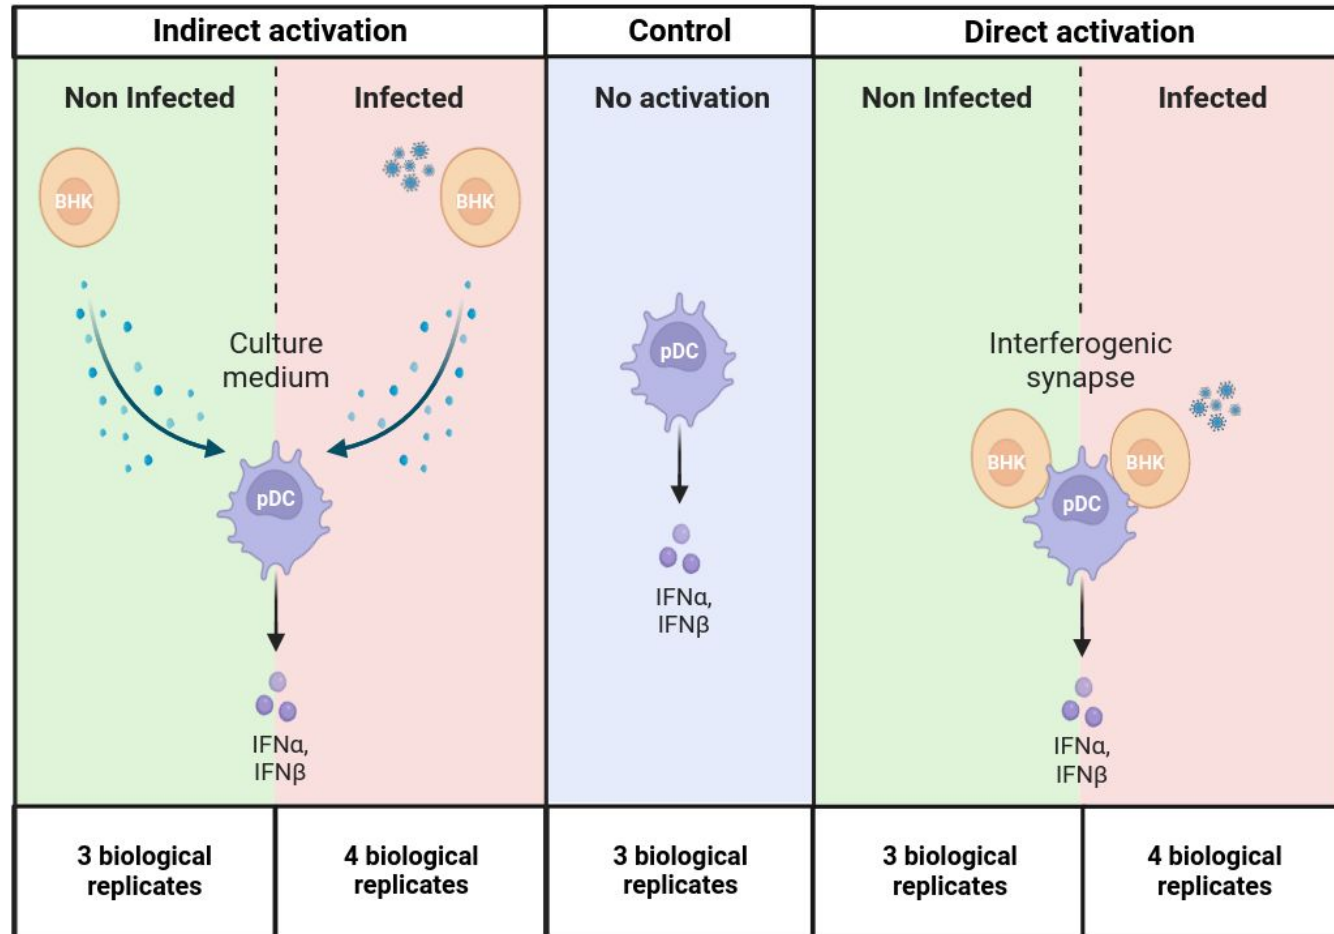

- AS in type 1 IFN as other immune cells ?
- Very little knowledge about AS in these cells and implications...

Introduction

RNAseq data
description :

- 2x150pb Paired-end Illumina seq (NovaSeq)
- Sequencing depth ~ 20-100 M reads
- BHK = Baby Hamster Kidney cells

Introduction

Aims of this project :

- Are the quality and depth of the dataset sufficient to detect signals of differential alternative splicing between conditions?
- If so, is there alternative splicing remodelling between conditions? And which transcripts are concerned?

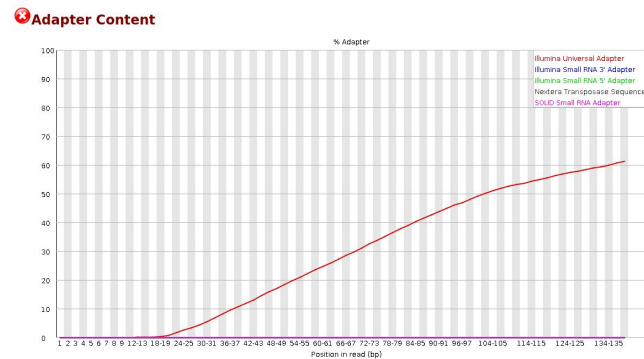

Preliminary analysis

- Gives an idea of the state of the dataset
- Helps in identifying problems from sequencing and earlier data manipulation

Preliminary analysis

FastQC

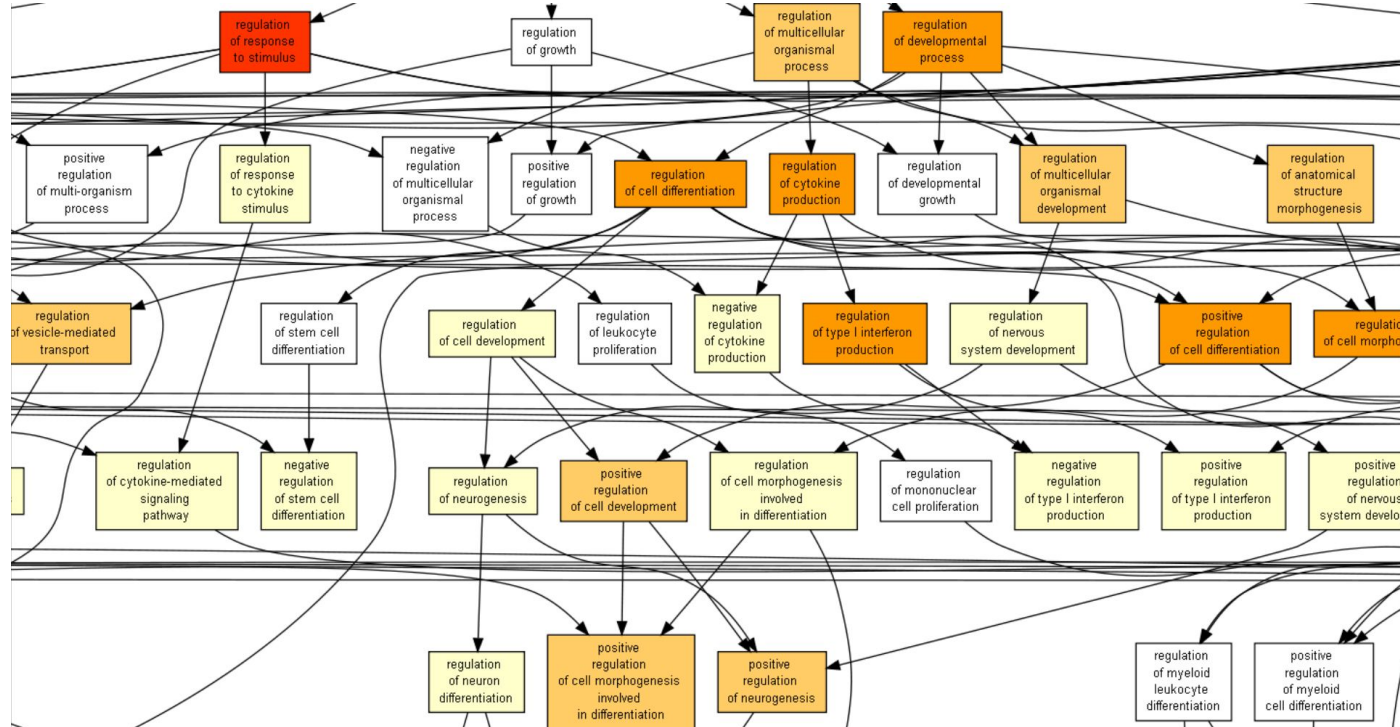

- Summarizes a variety of stats such as quality scores and GC content
- Ran on raw data

Preliminary analysis

GO diagram

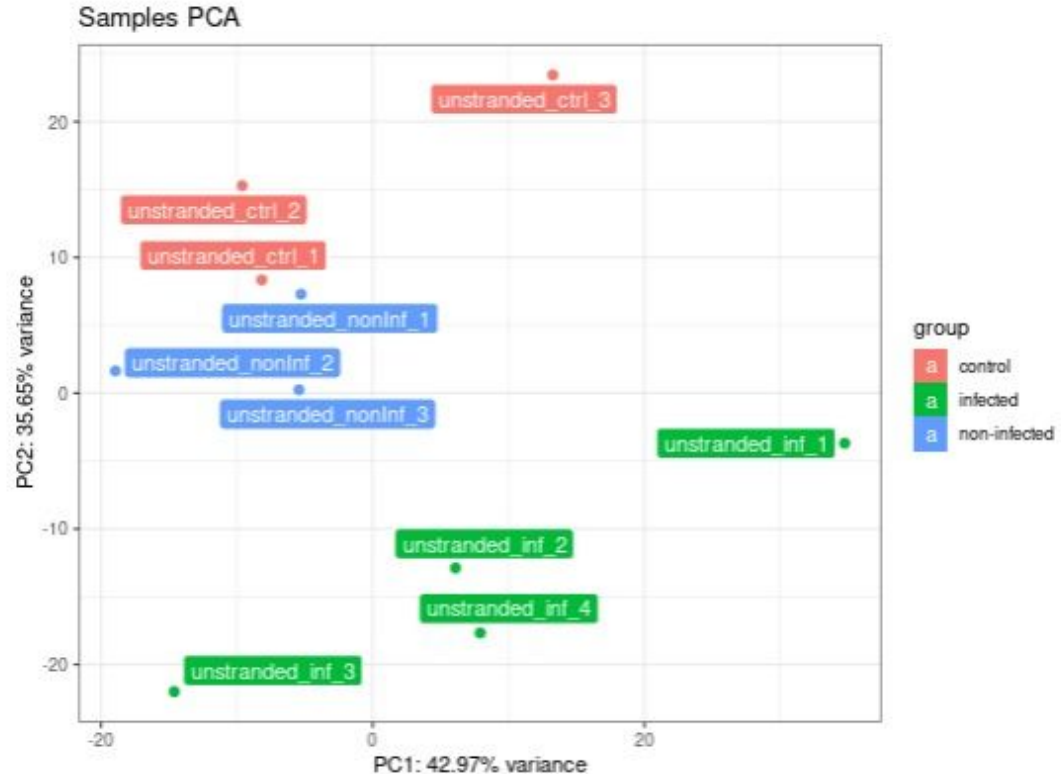

- Summarizes molecular function, cellular components and biological processes

Preliminary analysis

PCA diagram

- Helps in identifying signals from the dataset
- PCA on transcript counts

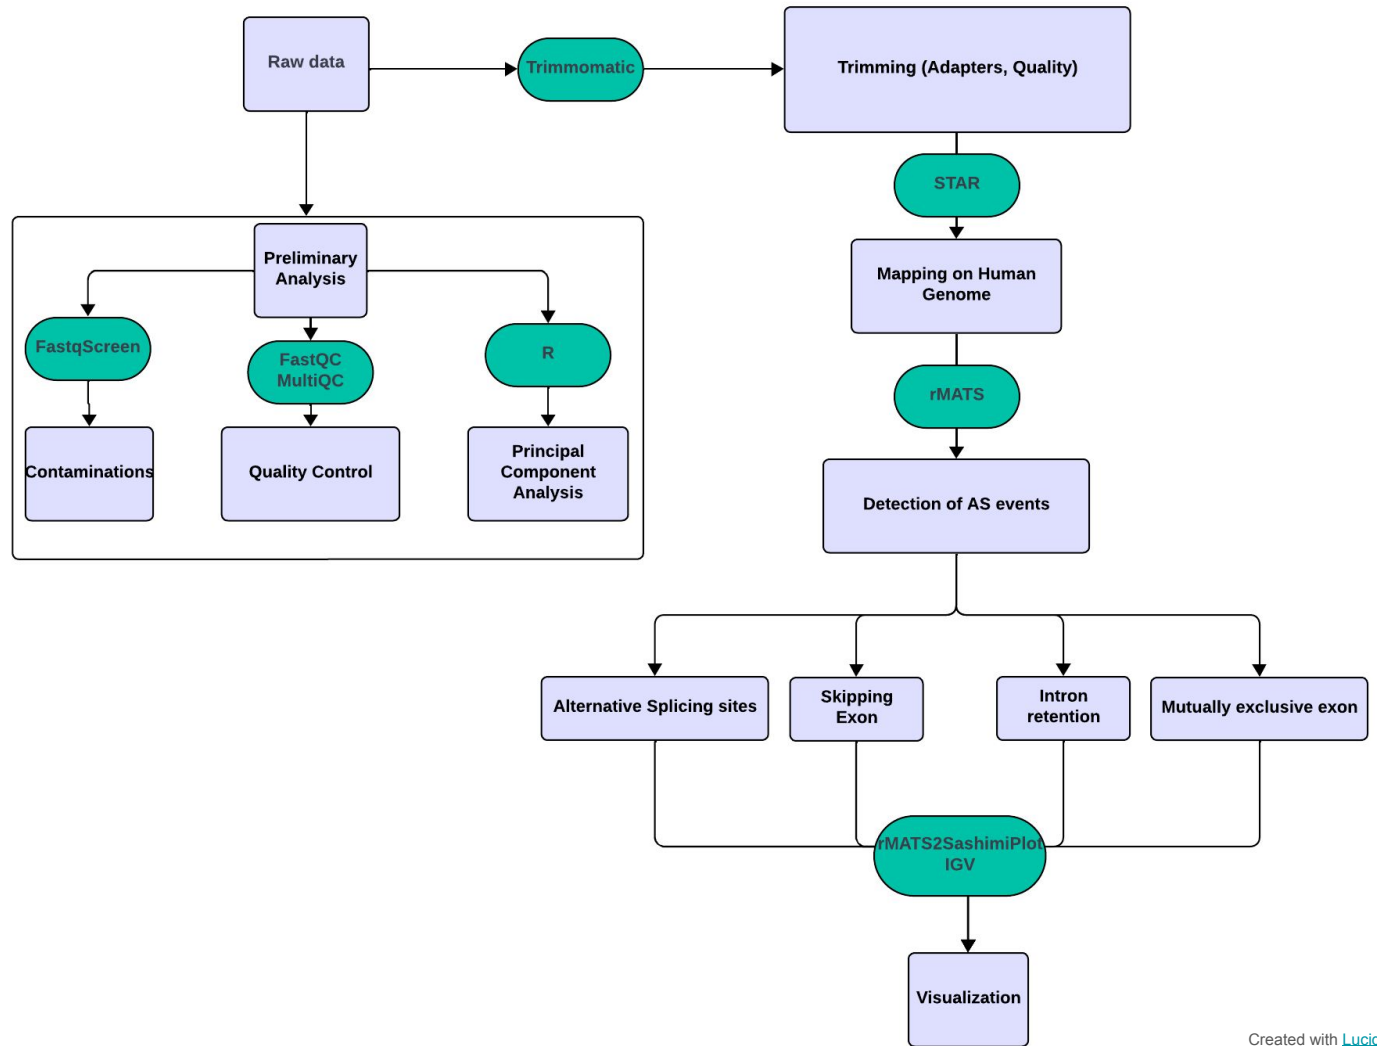

Preliminary analysis

FastQscreen

- Determines from where the sequences in our data originates
- Helps in detecting contamination
- Samples 7015, 7018, 7020 and 7024

Pipeline

Results: Mapping - STAR

	pDC (activation indirecte)	pDC + BHK (activation directe)
Reference genome	hg38	hg38
Alignment scores	homogeneous (~55%)	highly fluctuating (10% to 50%)

How to sort pdc + BHK reads ?

Concatenated index

Analysis with RMATS : Procedure

What about pDC with direct contact of BHK ?

mapping scores + Not_Infected sample's quality analysis  pre_List only

Alternative splicing events: Results

	SE	MXE	RI	A5SS	A3SS
Genes with alternative splicing due to infection without direct activation	"SMG1" "HNRNPD" "LPIN1" "HNRNPA3" "IRF7"	"LDHA" "ITGAL"	"HGS" "ANAPC5" "YJU2B" "ARHGAP4" "FN1" "COPA" "CARS2"		"CNBP"

	SE	MXE	RI	A5SS	A3SS
Genes with alternative splicing and direct activation to BHK cells	"HNRNPA3" "TPM2"		"MYH9" "CIRBP" "GOLGA3" "ANAPC5" "MTCH1" "EWSR1" "ANKRD11" "CTSC"		

Functional analysis: ITGAL

- Integrin: involved in synaptogenesis
- essential role in immune processes:
 - leukocytes - endothelial cells interaction
 - clearance by cytotoxic T cells, granulocytes and monocytes.
 - phagocytosis of apoptotic neutrophils by macrophages
- involvement in lymphopoiesis

Functional analysis:

IRF7

- transcriptional regulator
- involved in type I interferon (IFN)-dependent immune responses
- critical role in innate immune defense against DNA and RNA viruses

Conclusion

Aims of this project :

- Are the quality and depth of the dataset sufficient to detect signals of differential alternative splicing between conditions?
 - ⇒ We can detect a signal, but the list of differentially spliced gene is very short
 - ⇒ A greater quality and depth sequencing should be better to extend the list and our trust in results
- If so, is there alternative splicing remodelling between conditions? And which transcripts are concerned?
 - ⇒ With provided dataset, interesting genes have been found, like IRF7 and ITGAL
